ABSTRACT:

PROBLEM TO BE SOLVED: To maintain the sensitivity for a radio wave received by a receiver.

SOLUTION: The receiver is a reception frequency selection system that selects a frequency received by a receiver 6 onboard a vehicle as for radio signals with different frequencies sent from pluralities of transmission stations of broadcast stations A-C. The reception frequency selection system is provided with a storage means 1 that stores broadcast station information 1a including frequency information and position information of each of pluralities of transmission stations A1-A3, B1-B3, C1, C2 of the broadcast stations A-C, a position means 2 that measures the position information of the vehicle, and a selection means 3 that obtains the frequency of the transmission stations A1-A3, B1-B3, C1, C2 at which the radio signal is received with the best sensitivity based on the relation between the position information of pluralities of the transmission stations A1-A3, B1-B3,

C1, C2 included in
broadcast station information 1a and the position
information of the vehicle
measured by the position means 2 and that selects the
obtained frequency.
